

Operating Instructions

Electric Proofer Box

- This cabinet is meant to hold the temperature of heated foods. It is not designed nor intended to heat cold foods.
- Make sure the cabinet is away from ventilation or cold drafts for best performance.
- You will need a dedicated 20amp Outlet.
- Allow a minimum of 30 minutes to reach the desired temperature.
- This unit has two modes: Proofing and Holding. When the unit is in "HOLD" mode, the element in the water pan does not activate, creating the humidity needed for the proofing mode.

Proofing Mode Instructions:

1. Fill the reservoir with DISTILLED water.
2. Push the "ON/OFF" switch to the "ON" position. The red indicator light will illuminate.
3. Pre-heat the cabinet. Push the "PROOF / HOLD" switch to the "HOLD" position.
4. Set the temperature control (marked temperature) to 7 or 8 to quickly heat the cabinet.
5. Upon temperature reaching 90°F – 100°F, push the "PROOF / HOLD" switch to the "PROOF" position.
6. Turn the temperature and humidity dial down to 7 or 8. The 1000-watt element in the water pan is activated, and the water can become VERY hot! **DO NOT TOUCH THE WATER!**
7. Maximum humidity has been reached once the internal temperature in your desired range is met, and the humidity begins to condense inside the cabinet. Setting the humidity any higher will only cause more water to condense and run down the cabinet's interior and drain out.
8. Turn the temperature and humidity dials to the appropriate levels for your use.
9. Turn the switch to the "OFF" position when done.

Holding Mode Instructions:

1. Push the "ON / OFF" switch to the "ON" position. The red indicator light will illuminate.
2. Push the "PROOF / HOLD" switch to the "HOLD" position.
3. Set the thermostat control (marked temperature) to 7 or 8 in the beginning to quickly heat the cabinet. Then adjust to your desired temperature. Temperature is read on the digital thermometer located on the cabinet's front panel.
4. Turn to the "OFF" position when done.
